

STAHL'S Hotronix® Hover Press™

Maximize the production of digital direct-to-garment printing with the new Hotronix® Hover Press™, a new patent pending heat press manufactured exclusively by Stahl's Hotronix®. The Hotronix® Hover Press™ increases color vibrancy by curing direct-to-garment inks. The upper platen actually hovers over the garment to ensure a stronger bond and brighter colors between the ink and the garment. Since there is no need for direct contact on the garment/graphic with this breakthrough technology, you never have to worry about messy direct-to-garment ink residue on your platen or Teflon® cover sheet again!

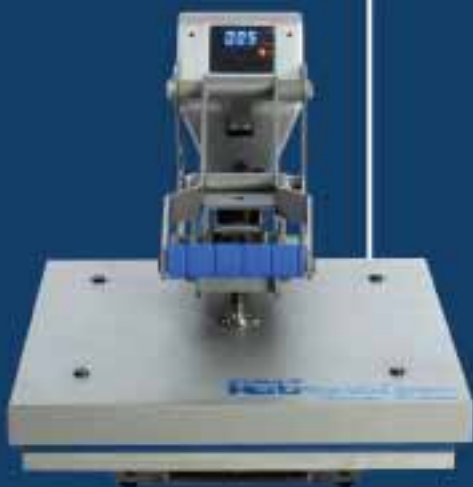

Features:

- **Two Modes** – The first setting is for off contact and the second is for pressure. In both settings, once the cycle has ended, the press automatically pops up ensuring that the shirt will not be scorched or burned even if the operator is not standing by the machine.
- **Three Settings** – The Hotronix® Hover Press™ can be set in three combinations. In addition to hover and pressure settings, it also can be set to hover on the first and second settings or apply pressure on both settings.
- **Digital Time, Temperature and Pressure Displays**
- **New Twin Timer™** feature for programming two independent time settings.
- **Automatic Open**
- **Magnetic Assist Lock Down**

Advantages:

- The press can be tailored to the job at hand and the different requirements it may have.
- Designed for direct-to-garment, it can also be used for any type of traditional heat-applied graphics.
